

Division through grouping

Arrays can be used to visually represent division. By drawing spots, the children can then group through circling to find the answer.

The picture shows 15 spots. If the children were asked to group them into 5s or were given the calculation 15 divided by 5, then the spots make it visually easy to do.

$$15 \text{ divided by } 5 = 3$$

This array can also be used for division as the picture shows. There are 12 spots in total but they can be divided in different ways.
